

Network Topology Mapping

A Feature Available with N-able N-central

Network topology mapping, available in N-able™ N-central®, gives you capabilities supporting in-depth network assessments—as well as intuitive ways of visually troubleshooting networking issues. You can automatically discover your entire network and create comprehensive, detailed network topology maps that allow you to quickly and easily visualize networks.

Maximize efficiency through automated and scheduled scans. Use the most up-to-date network maps to troubleshoot or onboard new clients, with scheduled scans to identify new or removed devices. Regardless of a network’s size, a visual representation of what’s working and what’s causing issues could save you time.

Help ensure complete visibility of a network to avoid causing issues or wasting valuable time when troubleshooting. Network topology mapping automatically detects new devices and changes to network topology with scheduled network scanning. Additionally, help new teammates learn the network layout faster with visual maps showing how your network is configured.

Key benefits

- Automatically map your network for clear visibility
- Auto-detect any changes to the network, such as devices added or removed
- Save time when troubleshooting issues with the network
- Get an easy-to-understand visual representation of your network and its interconnectivity

5 reasons MSPs use network topology mapping

- To onboard new clients or gain insights into a network during pre-sale
- To help ensure the network meets compliance standards
- To audit and manage inventory
- To modify an existing client’s network, such as adding a device or changing routing
- To troubleshoot or investigate network connectivity issues quickly and easily
