Secure Delivery of Websites and Web Applications

Thanks to oneclick™ Website Access Protection, any web app or website becomes securely available and mobile through the oneclick™ Workspace. Whereas previously every subsidiary or user needed a separate VPN connection, with oneclick™, only one secure connection is required between the hosting location and the oneclick™ platform.

The web application can be delivered to any number of users, e.g. partner, homeworker or external service provider. Typical applications are for example SharePoint, Digital Asset Management systems, ERP systems or industry software.
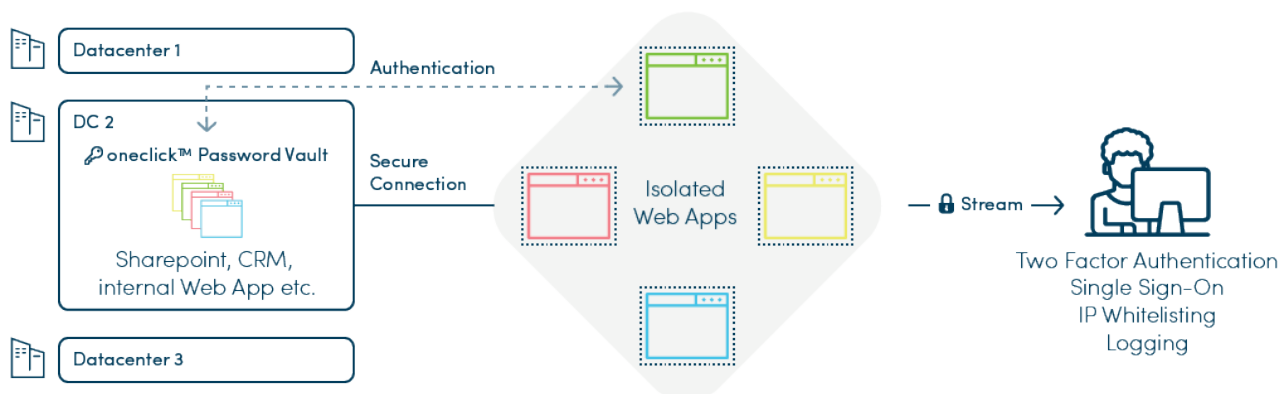

With oneclick™ Website Access Protection, the user only connects to the oneclick™ platform instead of directly connecting to the web application or the associated data he desires to access. The web application is opened in an isolated environment and will be displayed to the user via an encrypted stream. Due to streaming, stored data does not leave its original hosting location and is kept under control. Therefore, oneclick™ offers a unique "browser in browser" technology which encrypts incoming and outgoing data transfer.

In contrary to other solutions, no additional terminal server or RDS licences are required. oneclick™ Website Access Protection provides the possibility to store log-in credentials in an encrypted form for each user without them having to know it. The password vault may reside in the company's own data centre. The registration at the web application is done via an automated log-in process. Hence, the user only requires one password to enter the oneclick™ platform and will be logged in to every integrated web application automatically, as soon as it is opened.
